

INTRODUCTION TO STATISTICS

PS07

Q1. Let X be a discrete random variable with probability mass function

$$P(X = x) = \begin{cases} 0.3 & x = -2 \\ 0.6 & x = -1 \\ 0.1 & x = 12 \\ 0 & \text{otherwise.} \end{cases}$$

Let X_1, \dots, X_n be an iid sequence of random variables with the same distribution as X . Let

\bar{X} be the sample mean (of X_1, \dots, X_n .)

(a) Find $E\bar{X}$.

(a)	Find $E(\bar{X})$
	$E(\bar{X}) = \sum x_i \cdot p(x_i)$
	$\Rightarrow (-2 \times 0.3) + (-1 \times 0.6) + (12 \times 0.1)$
	$\Rightarrow -0.6 - 0.6 + 1.2$
	$E(\bar{X}) = 0$

(b) Find $\text{Var}(\bar{X})$.

(b)	$V(\bar{X}) = E(\bar{X}^2) - [E(\bar{X})]^2$
	$E(\bar{X}^2) = \sum x_i^2 \cdot p(x_i)$
	$\Rightarrow (-2^2 \times 0.3) + (-1^2 \times 0.6) + (12^2 \times 0.1)$
	$\Rightarrow 1.2 + 0.6 + 14.4$
	$\Rightarrow E(\bar{X}^2) = 16.2$
	$V(\bar{X}) = E(\bar{X}^2) - [E(\bar{X})]^2 = 16.2 - 0$
	$V(\bar{X}) = 16.2$

(c) What is the expected value of \bar{X} ?

(c)	$E(\bar{X}) = E(X) = 0$
-----	-------------------------

(d) What is the variance of \bar{X} ? (Note: This will depend on n .)

$$\begin{aligned} \text{(d)} \quad V(\bar{X}) &= \frac{\sigma^2}{n} = \frac{16.2}{3} \left[\begin{array}{l} \text{since, no. of values } x = -2, -1, 1, 2 \\ \text{hence } n=3 \end{array} \right] \\ V(\bar{X}) &= 5.4 \rightarrow \sigma_{\bar{X}}^2 \\ \sigma_{\bar{X}} &= \sqrt{5.4} = 2.323 \end{aligned}$$

(e) Suppose $n = 100$. Use the R function `pnorm()` to find the approximate probability that

\bar{X} is greater than 0.5

```
> mu<- 0
> sd<- 2.323
> n<- 100
> xbar<- 0.5
> Z<- (xbar-mu)/(sd/sqrt(n))
> Z
[1] 2.152389
> pnorm(Z)
[1] 0.9843166
> 1-pnorm(Z)
[1] 0.01568336
```

Q2. I downloaded data on the number of citations for a random sample of 1000 journal articles published in 1981. (The data is from the ISI Citation Indexes.) I ran some analysis on the data in R, and produced the following output:

```
> citations = scan("citations.txt")
Read 1000 items
> summary(citations)
   Min. 1st Qu.  Median    Mean 3rd Qu.    Max.
   0.00   0.00   1.00   9.06   7.25  300.00
> var(citations)
[1] 565.2476
> # Number of articles with no citations
> sum(citations == 0)
[1] 460
```

- (a) Is the distribution of the number of citations (i) exactly normal, (ii) approximately normal, or (iii) not close to normal? How do you know?
- (b) Find an appropriate 95% confidence interval for the mean number of citations,
- (c) Find an approximate 95% confidence interval for the proportion of journal articles with no citations.
